Abstract The neutrosophic interval statistical number (NISN) has been known to be very useful in expressing the interval values under indeterminate environments. One of the essential and so important useful as tools for measuring the degree of similarity between sets of given objects is the similarity measure . In this paper, neutrosophic numbers as well as the generalized Dice similarity measure for neutrosophic numbers for two sets are defined after which the axioms of fuzziness similarity and symmetry satisfying the NISN the properties were proved.

Keywords: Fuzziness; Similarity; Symmetry Properties Neutrosophic Interval ; generalized dice similarity measure (GDSM)

AMS Mathematics Subject Classification 2020: **Primary:** 62D05 **Secondary:** 62L10

1. Introduction

Multiple problems such as the attributes in decision making processes are often being solved using the hesitant fuzzy linguistic information. As such, some algorithms can be developed in order for the utilization of the generalized Dice similarity measures giving required solutions. The Dice similarity coefficient is a statistical tool. What it does is to measure the similarity between two given sets of data. It can also be referred to as the Sørensen–Dice index. (see [1]) We can also call it simply as the Dice coefficient. Some functions of which the similarity degree are expressed which involves certain items can be used in physical entities and phenomenon such as anthropology, automatic classification, psychology, ecology, information retrieval, citation analysis, numerical taxonomy and patterns recognition. The degree of dissimilarity or similarity between any given sets of objects plays a very important and vital role. space, Most especially, in vector the cosine Jaccard, as well as the Dice similarity measures are often very useful in citation analysis, information retrieval, and also in automatic classification. In many

cases, the Dice similarity measures as well as the asymmetric measures (also known as the projection measures) happen to be the special cases in some parameter values.

2. The Method As Adopted On The Interval Probability And The Neutrosophic Statistical Number

The Neutrosophic interval statistical number is a form of interval sets or range of certain values. It can be in the form of intervals (closed, half closed, half open or open) such as: $[x, y]$, $[x, y)$, $(x, y]$, and (x, y) , where x and y are real numbers.

The neutrosophic interval probability (NIP) has been defined in a range given by: $[V^L, V^U]$ of individuals in the given sample. (see [4, and 5]) The form of a NIP form can be clearly expressed as follows: $D = \langle [V^L, V^U], (D_T, D_I, D_F) \rangle$, where, are the true probability is given by D_T , while that of indeterminate, and false probabilities are given as D_I and D_F . Each of these could be found respectively in the range of the determinate, indeterminate, and failure. Now for each trial data, we have that the neutrosophic interval probability defined in an equational form as follows:

$$D_T = \frac{n_T}{n}, \quad D_I = \frac{n_I}{n} \text{ and } D_F = \frac{n_F}{n}$$

Here, n is the total number of the individuals totals n . is the Some number of samples falls in the interval $[v_m - \sigma, v_m + \sigma]$. This is denoted by n_T . For n_I , the interval is given by: $[v_m - 3\sigma, v_m - \sigma]$ and for n_F , it is given by: $(v_m + \sigma, v_m + 3\sigma)$, which is the number of the rest samples. Also, v_m is the statistical mean value while the standard deviation is represented by σ . The addition of all the probabilities equals 1. Efforts were intensified to clarify the proof the axioms of fuzziness similarity and symmetry satisfying the NISN the properties were proved (see also, [6, 7, and 8]).

2.1 On the Numerical Neutrosophic Numbers

Here, (in this case, in a way to approximate the imprecise data the indeterminacy "I" is always given as real subsets. Hence, making it more general than the interval. This is because "I" may be given as any subset. Take instance, $N = 8 + 6I$, where "I" is in the discrete hesitant subset $\{0.4, 0.9, 6.4, 55.6\}$ in this case having only four elements, which is not part of interval analysis (such as in statistics). But for the interval statistics, the interval $[0.4, 55.6]$ is taken so as to include those given numbers which fall within the given range of the intervals. But then, with this, the level of the uncertainty seems to increase so much considerably. Now, in cases where the "I" is an interval given as $I = [I_1, I_2]$, with $I_1 \leq I_2$, we are going to have that $N = x + yI$. This actually coincides with the interval which is given by: $N = [x + yI_1, x + yI_2]$. (please , see [10] for more details)

3. The Fuzziness, Similarity And The Symmetry Properties

3.1 The Fuzziness Condition A1. $0 \leq E(R_A, R_B) \leq 1$

Definition 1: (see [3]) : For a classical Neutrosophic Number, the standard form can be expressed as $a+bI$. Also, a as well as b are real number coefficients. I is the indeterminacy, whence $0 \cdot I = 0$ and $I^2 = I$ are both true. Hence, we have that $I^n = I$, and this is true for each of the positive integer given by n . Now, we call $a+bI$ the **Neutrosophic Real Number** whenever the two arbitrary coefficients a as well as b are real numbers.

Furthermore, it should be well noted here, that we have literal neutrosophic numbers, $a+bI$, where $I =$ letter, and $I^2 = I$, and numerical neutrosophic numbers, $a+bI$, where $I =$ a real subset (normally interval). But herein $I^2 \neq I$.

Take for example, the following, as quoted from [3]:

- a. $[10.2, -8]^2 = [-10.2, -8] \cdot [-10.2, -8] = [64, 104.04]$.
- b. $[-14.25, -9]^2 = [(-9)^2, (-14.25)^2] = [81, 203.0625]$
- c. $[13.8, 16]^2 = [13.8^2, 16^2] = [190.44, 256]$
- d. $[1.8, 10]^2 = [1.8^2, 10^2] = [3.24, 100]$

By this, $I^2 \neq I$.

Definition 2: (see [9]) :An important measure about the similarity in between two objects can sometimes be referred to as the Similarity measures (SMs). A special kind of such measures often applied to be used mostly in comparing objects is the generalized dice similarity measure (GDMS).

Definition 3: (see [3]): Suppose that $R_A = a_A + b_A I$ (i) and $R_B = a_B + b_B I$(ii)are neutrosophic numbers, such that each of $a_A, b_A, a_B,$ and $b_B \geq 0$. We define a generalized dice similarity measure in this manner in between R_A and R_B :

$$E(R_A, R_B) = \frac{2R_A R_B}{|R_A|^2 + |R_B|^2} = L \quad (\text{say})$$

$$\text{Then, } L = 2x \frac{(a_A + \inf(b_A I))(a_B + \inf(b_B I)) + (a_A + \sup(b_A I))(a_B + \sup(b_B I))}{(a_A + \inf(b_A I))^2 + (a_A + \sup(b_A I))^2 + (a_B + \inf(b_B I))^2 + (a_B + \sup(b_B I))^2}$$

(Note that each of $(a_A + \inf(b_A I)), (a_B + \inf(b_B I)), (a_A + \sup(b_A I)),$ and $(a_B + \sup(b_B I))$ is a real number since each of the components such as $a_A, \inf(b_A I), a_B, \inf(b_B I)$, etc. is real number). We have, $L =$

$$\frac{2(a_A + \inf(b_A I))(a_B + \inf(b_B I)) + 2(a_A + \sup(b_A I))(a_B + \sup(b_B I))}{[(a_A + \inf(b_A I))^2 + (a_B + \inf(b_B I))^2] + [(a_A + \sup(b_A I))^2 + (a_B + \sup(b_B I))^2]}$$

$$= \frac{2(a_A + \inf(b_A I))(a_B + \inf(b_B I)) + 2(a_A + \sup(b_A I))(a_B + \sup(b_B I))}{2(a_A + \inf(b_A I))(a_B + \inf(b_B I)) + 2(a_A + \sup(b_A I))(a_B + \sup(b_B I)) + [(a_A + \inf(b_A I)) + (a_B + \inf(b_B I))]^2 + [(a_A + \sup(b_A I)) + (a_B + \sup(b_B I))]^2}$$

Dividing through by $2(a_A + \inf(b_A I))(a_B + \inf(b_B I)) + 2(a_A + \sup(b_A I))(a_B + \sup(b_B I))$

We have :
$$\frac{1}{1 + [(a_A + \inf(b_A I)) + (a_B + \inf(b_B I))]^2 + [(a_A + \sup(b_A I)) + (a_B + \sup(b_B I))]^2} \quad (k)$$

(Here , it should be observed that since $(X + Y)^2 = X^2 + Y^2 + 2XY$, it implies that $X^2 + Y^2 = (X + Y)^2 - 2XY$)

Obviously , this is a positive number which is greater than 0. Hence, this satisfies the left hand side of the inequality. i.e $0 \leq L = E(R_A, R_B)$

Now, to show that L is less or equal to 1, observe that the denominator is positive since the addition of positive numbers is positive, whence the square of any real number is positive. We thus prove this by contradiction. Assume that $L \not\leq 1$.

Let $X^2 = [(a_A + \inf(b_A I)) + (a_B + \inf(b_B I))]^2 + [(a_A + \sup(b_A I)) + (a_B + \sup(b_B I))]^2$ We have that $L = \frac{1}{1 + X^2} > 1$, we have that $1 > 1 + X^2 \Rightarrow X^2 < 0$. A contradiction ($\Rightarrow \Leftarrow$). Hence, $0 \leq E(R_A, R_B) \leq 1$. This satisfies A1 ■

3.2 The Similarity Condition A2. $E(R_A, R_B) = 1$ iff $R_A = R_B$

Proof :

(\Leftarrow) Assume that $R_A = R_B = R = a + bI$

Then, by definition, $E(R_A, R_B) = E(R, R) = \frac{2R_A \cdot R_B}{|R_A|^2 + |R_B|^2} = \frac{2R \cdot R}{|R|^2 + |R|^2}$

$$2 \times \frac{(a + \inf(bl))(a + \inf(bl)) + (a + \sup(bl))(a + \sup(bl))}{(a + \inf(bl))^2 + (a + \sup(bl))^2 + (a + \inf(bl))^2 + (a + \sup(bl))^2}$$

$$= \frac{2(a + \inf(bl))(a + \inf(bl)) + 2(a + \sup(bl))(a + \sup(bl))}{(a + \inf(bl))^2 + (a + \sup(bl))^2 + (a + \inf(bl))^2 + (a + \sup(bl))^2}$$

$$= \frac{2(a + \inf(bl))(a + \inf(bl)) + 2(a + \sup(bl))(a + \sup(bl))}{2(a + \inf(bl))^2 + 2(a + \sup(bl))^2}$$

$$= \frac{2(a + \inf(bI))^2 + 2(a + \sup(bI))^2}{2(a + \inf(bI))^2 + 2(a + \sup(bI))^2} = 1.$$

(\Rightarrow) Assume that $E(R_A, R_B) = \frac{2R_A R_B}{|R_A|^2 + |R_B|^2} = 1$. Then, $2R_A R_B = |R_A|^2 + |R_B|^2$

$$\begin{aligned} &\Rightarrow 2(a_A + \inf(b_A I))(a_B + \inf(b_B I)) + (a_A + \sup(b_A I))(a_B + \sup(b_B I)) \\ &= (a_A + \inf(b_A I))^2 + (a_A + \sup(b_A I))^2 + (a_B + \inf(b_B I))^2 + (a_B + \sup(b_B I))^2 \end{aligned}$$

$$\begin{aligned} &\Rightarrow 2(a_A + \inf(b_A I))(a_B + \inf(b_B I)) + 2(a_A + \sup(b_A I))(a_B + \sup(b_B I)) \\ &= (a_A + \inf(b_A I))^2 + (a_B + \inf(b_B I))^2 + (a_A + \sup(b_A I))^2 + (a_B + \sup(b_B I))^2 \end{aligned}$$

Equating components, we have,

$$\begin{aligned} 2(a_A + \inf(b_A I))(a_B + \inf(b_B I)) &= (a_A + \inf(b_A I))^2 + (a_B + \inf(b_B I))^2 \\ \text{And } 2(a_A + \sup(b_A I))(a_B + \sup(b_B I)) &= (a_A + \sup(b_A I))^2 + (a_B + \sup(b_B I))^2 \end{aligned}$$

$$\Rightarrow (a_A + \inf(b_A I)) = (a_B + \inf(b_B I)) = (a + \inf(bI))$$

$$\text{and } (a_A + \sup(b_A I)) = (a_B + \sup(b_B I)) = (a + \sup(bI)) \quad (\text{say})$$

$\Rightarrow R_A = R_B$ with the condition that :

$$\begin{cases} 2(a_A + \inf(b_A I))(a_B + \inf(b_B I)) = (a_A + \inf(b_A I))^2 + (a_B + \inf(b_B I))^2 \\ \text{And } 2(a_A + \sup(b_A I))(a_B + \sup(b_B I)) = (a_A + \sup(b_A I))^2 + (a_B + \sup(b_B I))^2 \end{cases}$$

This satisfies A2 ■

3.3 The Symmetry Condition P3. $E(R_A, R_B) = E(R_B, R_A)$

Proof :

We have that , $E(R_A, R_B) = \frac{2R_A R_B}{|R_A|^2 + |R_B|^2}$

$$= 2 \times \frac{(a_A + \inf(b_A I))(a_B + \inf(b_B I)) + (a_A + \sup(b_A I))(a_B + \sup(b_B I))}{(a_A + \inf(b_A I))^2 + (a_A + \sup(b_A I))^2 + (a_B + \inf(b_B I))^2 + (a_B + \sup(b_B I))^2}$$

$$\begin{aligned}
&= 2x \frac{(a_B + \inf(b_{B1})) (a_A + \inf(b_{A1})) + (a_B + \sup(b_{B1})) (a_A + \sup(b_{A1}))}{(a_B + \inf(b_{B1}))^2 + (a_B + \sup(b_{B1}))^2 + (a_A + \inf(b_{A1}))^2 + (a_A + \sup(b_{A1}))^2} \\
&= \frac{2R_B \cdot R_A}{|R_B|^2 + |R_A|^2} = E(R_B, R_A). \text{ This satisfies A3} \quad \blacksquare
\end{aligned}$$

3.4 The Fuzzy Condition A4. $0 \leq E(A, B) \leq 1$

Definition 3: (see [2]): Let $A = \{R_{A1}, R_{A2}, \dots, R_{An}\}$ and $B = \{R_{B1}, R_{B2}, \dots, R_{Bn}\}$ be two sets which are neutrosophic numbers, and that $R_{Ak} = a_{Ak} + b_{Ak}I$, $R_{Bk} = a_{Bk} + b_{Bk}I$ such that $(k = 1, 2, \dots, n)$. In addition, each of a_{Aj} , b_{Aj} , a_{Bj} and b_{Bj} is positive. i.e. ≥ 0 . Then, the number which is called the generalized Dice similarity measure in between the sets A and B can be usually being found by using the expansion given as :

$$\begin{aligned}
E(A, B) &= \sum_{j=1}^n w_j \frac{2R_{Aj} \cdot R_{Bj}}{|R_{Aj}|^2 + |R_{Bj}|^2} \\
&= 2 \sum_{j=1}^n w_j \frac{(a_{Aj} + \inf(b_{Aj}I))(a_{Bj} + \inf(b_{Bj}I)) + (a_{Aj} + \sup(b_{Aj}I))(a_{Bj} + \sup(b_{Bj}I))}{(a_{Aj} + \inf(b_{Aj}I))^2 + (a_{Aj} + \sup(b_{Aj}I))^2 + (a_{Bj} + \inf(b_{Bj}I))^2 + (a_{Bj} + \sup(b_{Bj}I))^2} \\
&= 2 \left(w_1 \frac{(a_{A1} + \inf(b_{A1}I))(a_{B1} + \inf(b_{B1}I)) + (a_{A1} + \sup(b_{A1}I))(a_{B1} + \sup(b_{B1}I))}{(a_{A1} + \inf(b_{A1}I))^2 + (a_{A1} + \sup(b_{A1}I))^2 + (a_{B1} + \inf(b_{B1}I))^2 + (a_{B1} + \sup(b_{B1}I))^2} \right) \\
&+ 2 \left(w_2 \frac{(a_{A2} + \inf(b_{A2}I))(a_{B2} + \inf(b_{B2}I)) + (a_{A2} + \sup(b_{A2}I))(a_{B2} + \sup(b_{B2}I))}{(a_{A2} + \inf(b_{A2}I))^2 + (a_{A2} + \sup(b_{A2}I))^2 + (a_{B2} + \inf(b_{B2}I))^2 + (a_{B2} + \sup(b_{B2}I))^2} \right) \\
&+ \dots + 2 \left(w_k \frac{(a_{Ak} + \inf(b_{Ak}I))(a_{Bk} + \inf(b_{Bk}I)) + (a_{Ak} + \sup(b_{Ak}I))(a_{Bk} + \sup(b_{Bk}I))}{(a_{Ak} + \inf(b_{Ak}I))^2 + (a_{Ak} + \sup(b_{Ak}I))^2 + (a_{Bk} + \inf(b_{Bk}I))^2 + (a_{Bk} + \sup(b_{Bk}I))^2} \right) \\
&+ \dots + 2 \left(w_n \frac{(a_{An} + \inf(b_{An}I))(a_{Bn} + \inf(b_{Bn}I)) + (a_{An} + \sup(b_{An}I))(a_{Bn} + \sup(b_{Bn}I))}{(a_{An} + \inf(b_{An}I))^2 + (a_{An} + \sup(b_{An}I))^2 + (a_{Bn} + \inf(b_{Bn}I))^2 + (a_{Bn} + \sup(b_{Bn}I))^2} \right)
\end{aligned}$$

Now, let $Q =$

$$\begin{aligned}
&2 \sum_{j=1}^n w_j \frac{(a_{Aj} + \inf(b_{Aj}I))(a_{Bj} + \inf(b_{Bj}I)) + (a_{Aj} + \sup(b_{Aj}I))(a_{Bj} + \sup(b_{Bj}I))}{(a_{Aj} + \inf(b_{Aj}I))^2 + (a_{Aj} + \sup(b_{Aj}I))^2 + (a_{Bj} + \inf(b_{Bj}I))^2 + (a_{Bj} + \sup(b_{Bj}I))^2} \\
&= \sum_{j=1}^n w_j \frac{2(a_{Aj} + \inf(b_{Aj}I))(a_{Bj} + \inf(b_{Bj}I)) + 2(a_{Aj} + \sup(b_{Aj}I))(a_{Bj} + \sup(b_{Bj}I))}{2(a_{Aj} + \inf(b_{Aj}I))(a_{Bj} + \inf(b_{Bj}I)) + 2(a_{Aj} + \sup(b_{Aj}I))(a_{Bj} + \sup(b_{Bj}I)) + [(a_{Aj} + \inf(b_{Aj}I)) + (a_{Bj} + \inf(b_{Bj}I))]^2 + [(a_{Aj} + \sup(b_{Aj}I)) + (a_{Bj} + \sup(b_{Bj}I))]^2}
\end{aligned}$$

Dividing through by $2(a_{Aj} + \inf(b_{Aj}I))(a_{Bj} + \inf(b_{Bj}I)) + 2(a_{Aj} + \sup(b_{Aj}I))(a_{Bj} + \sup(b_{Bj}I))$

We have that : $Q =$

$$\sum_{j=1}^n w_j \frac{1}{1 + [(a_{Aj} + \inf(b_{Aj}I)) + (a_{Bj} + \inf(b_{Bj}I))]^2 + [(a_{Aj} + \sup(b_{Aj}I)) + (a_{Bj} + \sup(b_{Bj}I))]^2}$$

$$(\text{ Here, } \sum_{j=1}^n w_j = w_1 + w_2 + w_3 + \dots + w_n = 1) \quad (*)$$

And clearly, the fraction is a positive number which is greater than 0. Hence, this satisfies the left hand side of the inequality. i.e $0 \leq Q = E(A, B)$

Now, to show : $Q \leq 1$, We thus prove this by contradiction. Assume that $Q \not\leq 1$.

$$\text{Let } Y_j^2 = [(a_{Aj} + \inf(b_{Aj}I)) + (a_{Bj} + \inf(b_{Bj}I))]^2 + [(a_{Aj} + \sup(b_{Aj}I)) + (a_{Bj} + \sup(b_{Bj}I))]^2$$

We have that $Q = \frac{1}{1 + Y_j^2} > 1$, we have that $1 > 1 + X^2 \Rightarrow X^2 < 0$. A

We have that $Q = \sum_{j=1}^n w_j \frac{1}{1 + Y_j^2} > 1$, we have that $1 > 1 + X^2 \Rightarrow X^2 < 0$. A

$$w_1 \frac{1}{1 + Y_1^2} + w_2 \frac{1}{1 + Y_2^2} + w_3 \frac{1}{1 + Y_3^2} + \dots + w_n \frac{1}{1 + Y_n^2} > 1$$

(And since $w_1 + w_2 + w_3 + \dots + w_n = 1$, let $w_j = \frac{1}{x_j^2}$)

$$\text{We have that } Q = \frac{1}{x_1^2} \frac{1}{(1 + Y_1^2)} + \frac{1}{x_2^2} \frac{1}{(1 + Y_2^2)} + \frac{1}{x_3^2} \frac{1}{(1 + Y_3^2)} + \dots + \frac{1}{x_n^2} \frac{1}{(1 + Y_n^2)} > 1$$

$$\frac{1}{x_1^2(1 + Y_1^2)} + \frac{1}{x_2^2(1 + Y_2^2)} + \frac{1}{x_3^2(1 + Y_3^2)} + \dots + \frac{1}{x_n^2(1 + Y_n^2)} > 1$$

Definitely, the LHS is not greater than 0. Hence, the initial assumption is false, and thus

$$0 \leq Q = \sum_{j=1}^n w_j \frac{1}{1 + [(a_{Aj} + \inf(b_{Aj}l)) + (a_{Bj} + \inf(b_{Bj}l))]^2 + [(a_{Aj} + \sup(b_{Aj}l)) + (a_{Bj} + \sup(b_{Bj}l))]^2} = E(A, B) \leq 1$$

This satisfies A4 ■

3.5 The Similarity Condition A5. $E(A, B) = 1$ provided that A and B are equal

Proof :

(\Leftarrow) If we assume that A and B are equal and are equal to R

$$\begin{aligned} \text{Then, } E(A, B) &= E(R, R) = \frac{2R \cdot R}{|R|^2 + |R|^2} = \\ &= 2 \sum_{j=1}^n w_j \frac{(a_{Rj} + \inf(b_{Rj}l))(a_{Rj} + \inf(b_{Rj}l)) + (a_{Rj} + \sup(b_{Rj}l))(a_{Rj} + \sup(b_{Rj}l))}{(a_{Rj} + \inf(b_{Rj}l))^2 + (a_{Rj} + \sup(b_{Rj}l))^2 + (a_{Rj} + \inf(b_{Rj}l))^2 + (a_{Rj} + \sup(b_{Rj}l))^2} \\ &= \sum_{j=1}^n w_j \frac{2(a_{Rj} + \inf(b_{Rj}l))^2 + 2(a_{Rj} + \sup(b_{Rj}l))^2}{2(a_{Rj} + \inf(b_{Rj}l))^2 + 2(a_{Rj} + \sup(b_{Rj}l))^2} \\ &= \sum_{j=1}^n w_j = w_1 + w_2 + w_3 + \dots + w_n = 1 \quad \text{by } (*) \quad \blacksquare \end{aligned}$$

3.6 The Symmetry Condition A6. $E[A, B] = E[B, A]$

$$\begin{aligned} D(A, B) &= \sum_{j=1}^n w_j \frac{2R_{Aj} \cdot R_{Bj}}{|R_{Aj}|^2 + |R_{Bj}|^2} \\ &= 2 \sum_{j=1}^n w_j \frac{(a_{Aj} + \inf(b_{Aj}l))(a_{Bj} + \inf(b_{Bj}l)) + (a_{Aj} + \sup(b_{Aj}l))(a_{Bj} + \sup(b_{Bj}l))}{(a_{Aj} + \inf(b_{Aj}l))^2 + (a_{Aj} + \sup(b_{Aj}l))^2 + (a_{Bj} + \inf(b_{Bj}l))^2 + (a_{Bj} + \sup(b_{Bj}l))^2} \\ &= 2 \sum_{j=1}^n w_j \frac{(a_{Bj} + \inf(b_{Bj}l))(a_{Aj} + \inf(b_{Aj}l)) + (a_{Bj} + \sup(b_{Bj}l))(a_{Aj} + \sup(b_{Aj}l))}{(a_{Bj} + \inf(b_{Bj}l))^2 + (a_{Bj} + \sup(b_{Bj}l))^2 + (a_{Aj} + \inf(b_{Aj}l))^2 + (a_{Aj} + \sup(b_{Aj}l))^2} \\ &= \sum_{j=1}^n w_j \frac{2R_{Bj} \cdot R_{Aj}}{|R_{Bj}|^2 + |R_{Aj}|^2} = D(B, A) \quad \text{This satisfies P6} \quad \blacksquare \end{aligned}$$

4 Applications

So far, it can be deduced that the fuzziness, similarity and the symmetry properties on the neutrosophic interval probability is of utmost importance and could be made applicable in similar cases.

5 Conclusion

Finally, the proofs of the **Fuzziness, Similarity And The Symmetry Properties On The Neutrosophic Interval Probability** have been fully given
